Machine Learning Notes - Semester 2

MACHINE LEARNING NOTES - MCA SEMESTER 2

1. Supervised learning: the model learns from labelled data. Examples are spam detection and house price prediction.

2. Classification predicts a category (logistic regression, decision trees, SVM). Regression predicts a number (linear regression).

3. Unsupervised learning finds structure in unlabelled data. K-means clustering groups similar points.

4. Overfitting happens when a model memorises training data. Use cross validation and regularisation to reduce it.
